

INSTALLATION/TROUBLESHOOTING GUIDE

NOTE: This installation is to be completed by an Authorized Dealer or Professional Service Technician. For questions regarding installation or warranty, call CDI Tech Support at 866-423-4832. Do not return to the Dealer or Distributor where the part was purchased. Contact CDI Electronics Directly for Return Materiel Authorization.

CDI P/N: 273-4849RS High Performance Stator 4 Cyl. 20 Amp

This stator replaces P/N: 584849 for Racing Applications.

This stator replaces P/N: 584849.

WARNING! This product is designed to be installed by a professional marine mechanic. CDI Electronics cannot be held liable for injury or damage resulting from improper installation, abuse, neglect or misuse of this product.

SERVICE NOTE: Discoloration of all the battery windings is an indication of a problem in the rectifier/regulator. Discoloration of only one post of the battery windings indicates a problem in the stator.

Installation

- 1. Remove the negative battery cable.
- 2. Remove the regulator/rectifier, power pack and timing covers.
- 3. Disconnect the timing sensor.
- 4. Disconnect the stator leads from the power pack and regulator/rectifier.
- 5. Carefully disconnect and remove the throttle linkage connected to the flywheel cover.
- 6. Remove the flywheel cover. Watch for the bendix washers and do not lose them.
- 7. Unbolt the flywheel.
- 8. Using the correct flywheel puller, remove the flywheel.
- 9. Disconnect the original stator plug from the power pack.
- 10. Remove the original stator, saving the original bolts.
- 11. Install the new stator using the original bolts with a good thread-locker applied (CDI 989-3977 is recommended) to the bolts and tightened to the factory torque specifications.
- 12. Connect the new stator to the power pack.
- 13. Connect the new stator to the regulator/rectifier (ignore any stripes on the rectifier as the new stator does not require the Yellow wires to be connected to a particular rectifier wire).
- 14. Replace the flywheel according to the service manual, using new bolts in the hub.
- 15. Replace the flywheel cover. Be sure the bendix washers are in place and that the bendix does not need lubricating.
- 16. Carefully connect the throttle linkage connected to the flywheel cover.
- 17. Connect the timing sensor.
- 18. Verify the ignition timing and reset according to the service manual.
- 19. Replace the battery cable.

Troubleshooting

No fire at all:

- 1. Disconnect the 4 wire harness connector from the power pack, if the engine now fires the kill circuit or harness is likely bad.
- 2. Check resistance for the brown wires. Brown to Brown/Yellow should read approximately 1100 ohms. DVA (peak voltage) should be 150v or more while connected to the power pack.
- 3. Orange to orange/black should read about 55 ohms. DVA (peak voltage) should be 15V or more while connected to the power pack.
- 4. Inspect the flywheel outer and trigger magnets to see if they are loose or broken.
- 5. Disconnect the rectifier/regulator and retest. If the fire returns, replace the rectifier/regulator.

High speed miss or weak hole shot:

CDI Electronics, LLC • 353 James Record Road SW • Huntsville, AL 35824 USA

Web Support: www.cdielectronics.com • Tech Support: 1-866-423-4832 • Order Parts: 1-800-467-3371 All rights reserved. Reproduction or use of content, in any manner, without express written permission by CDI Electronics, LLC., is prohibited.

- Connect DVA meter to between the brown wires and do a running test. AT NO TIME SHOULD THE VOLTAGE EXCEED 400v. If it does, the regulator circuit in the power pack is bad. The voltage should show a smooth climb and stabilize, gradually falling off at high RPM (above 5000). If you see a sudden drop in voltage right before the miss becomes apparent, the problem is likely in the stator.
- 2. Disconnect rectifier/regulator and retest. If the problem disappears, replace the rectifier/regulator and retest.

Quick Start Does Not Work:

- 1. Check the resistance from the Orange to the Orange/Black wires. You should read about 55 ohms.
- Check DVA voltage from the Orange to the Orange/Black wires while connected to the power pack. The reading should be between 8 and 24V. A reading above 24V indicates a problem in the power pack while a reading below 8 volts usually indicates a problem in the stator.

Thank you for using CDI Electronics.
